**Procedure:**

- Ovariohysterectomy (female)
- Neuter (male)
- Onychectomy (declaw)
- Microchip
- Mass Removal – Location \_\_\_\_\_
- Other \_\_\_\_\_

With any surgical procedure requiring general anesthesia, there is some risk for the patient. To minimize such risk, we require a pre-surgical screen.

**\*\*\*CHECK FOR DECIDUOUS TEETH\*\*\* initial**

**For patients over 6 years of age:** (Senior) The screen includes a complete blood count (CBC), blood chemistry (Chem), urinalysis (UA), & early renal damage screen (ERD). With cats, a thyroid test is also needed. This screen checks proper organ function, the ability of the patient's body to fight infection, as well as looking for evidence of existing infection. The screen also provides a baseline for your veterinarian to compare future values.

**For patients 2 – 6 years of age:** (Adult) The screen includes a mini profile (Mini), complete blood count (CBC), & early renal damage (ERD). This screen checks proper organ function, the ability of the patient's body to fight infection, as well as looking for evidence of existing infection. The screen also provides a baseline for your veterinarian to compare future values.

**For patients less than 2 years old:** (Juvenile) The screen includes a mini profile (Mini). This screen checks proper organ function, the ability of the patient's body to fight infection, as well as looking for evidence of existing infection. The screen also provides a baseline for your veterinarian to compare future values.
